Sample AI Explanation #1:

WHAT IS THE PROBLEM: 231 orders records were removed from the reporting database because the valid_ship_mode field contained a null value, which was anomalously high in orders_2 (11.4%) from Region 3.

WHY THIS RECORD TYPE CANNOT BE ACCEPTED: Records with a missing valid_ship_mode cannot be linked to a shipping method, so the system cannot determine delivery status, and any calculations of on-time delivery or shipping cost are impossible.

WHAT IS AT RISK: The delivery performance report is affected. The data team must correct the missing valid_ship_mode values in the affected files and reprocess the data before the audit deadline.

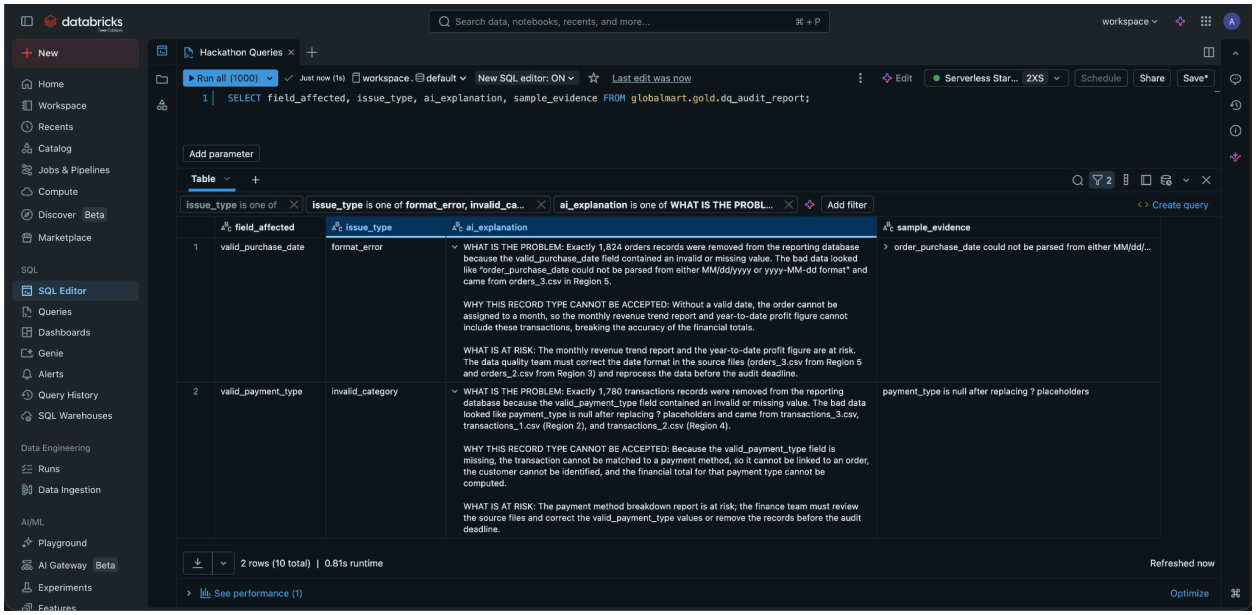
Sample AI Explanation #2:

WHAT IS THE PROBLEM: Exactly 3,337 transaction records were removed from the reporting database because the valid_profit field was null or contained a string that could not be converted to a decimal after removing the $ sign. These records came from transactions_2.csv for Region 4.

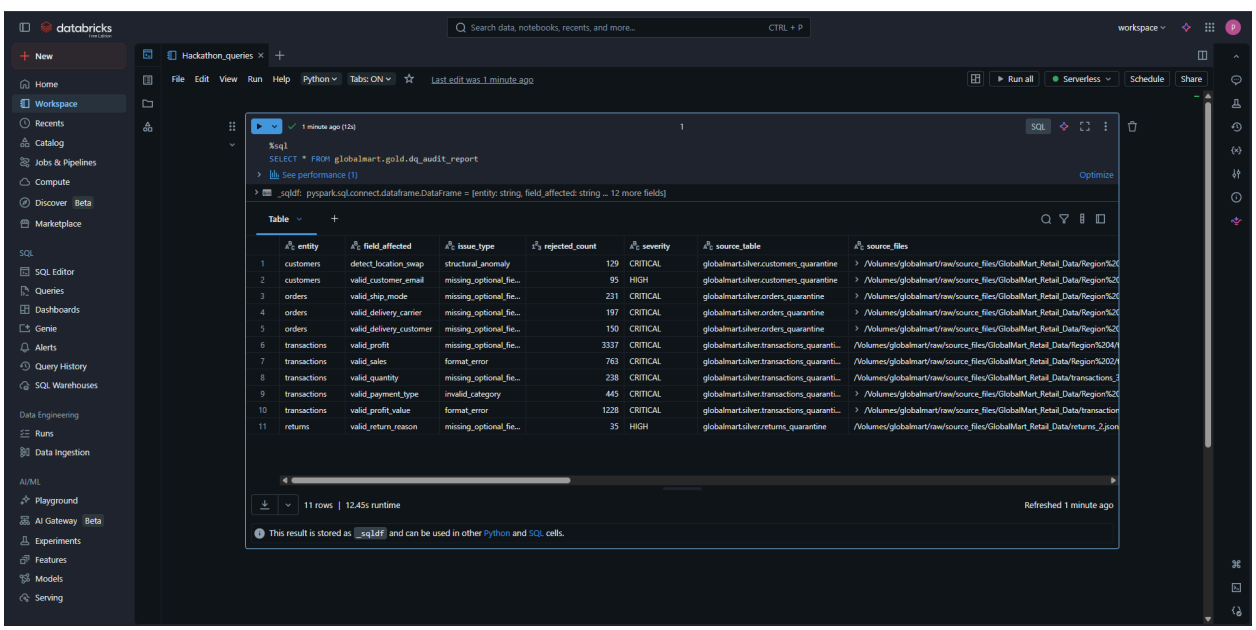
WHY THIS RECORD TYPE CANNOT BE ACCEPTED: Because the valid_profit value is missing or invalid, the profit margin for each transaction cannot be calculated, so the total profit for Region 4 cannot be summed. This breaks the profit margin report and any financial totals that rely on valid_profit.

WHAT IS AT RISK: The profit margin report for Region 4 is blank because 3,337 transactions had missing or invalid valid_profit values. The Regional Finance Manager for Region 4 must correct the source data and reprocess the transactions before the audit deadline.

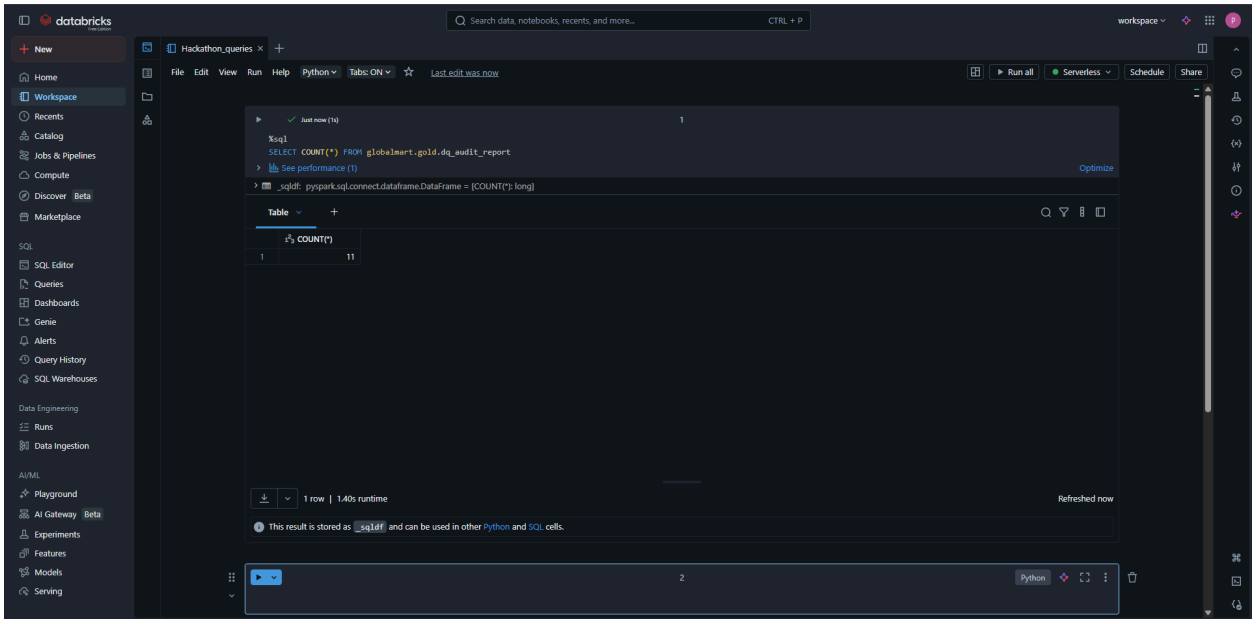
Sample AI Explanations:



Select All:



Select Count:



Select Schema:

	col_name	data_type	comment
1	entity	string	Represents the specific data entity that is experiencing quality issues as identified in the audit report.
2	field_affected	string	Contains the name of the field within the entity that has been impacted by the data quality issue.
3	issue_type	string	Describes the type of issue identified, providing insight into the nature of the data quality problems encountered.
4	rejected_count	int	Indicates the total number of records that were rejected due to the identified data quality issues.
5	severity	string	Categorizes the level of impact the data quality issue has, helping to prioritize corrective actions.
6	source_table	string	Identifies the original table from which the data is sourced, offering context for where the issues originated.
7	source_files	string	Lists any source files associated with the data that contain the quality issues, aiding in tracking down the origin of the problems.
8	earliest_failure	string	Records the timestamp of the first occurrence of the data quality issue, providing a timeline for analysis.
9	latest_failure	string	Notes the timestamp of the most recent incidence of the issue, highlighting the ongoing nature of the data quality concern.
10	sample_evidence	string	Presents examples or samples of the data that demonstrate the quality issues, supporting further investigation.
11	ai_explanation	string	Offers an explanation generated by AI regarding the detected issue, helping users understand the potential reasons behind the failures.
12	llm_check	string	Indicates whether a language model check was performed on the data regarding the quality issue.
13	llm_check_detail	string	Provides detailed results or findings from the language model check that might help clarify the issues identified.
14	generated_at	string	Shows the timestamp when the audit report was generated, serving as a reference point for the data quality assessments.
